

From the graph below, we could see that the impact of internet coverage on Happiness score is nearly linear with narrow confidence bands. This is consistent with the relationship across continents. Also, it seems that the impact of Internet coverage is the same across all continents as the slopes are comparable. Thus I doubt that this so called happiness score is more likely to represent some development variable, e.g. Internet coverage, rather than to a mixture of various aspects of the society

Happiness vs. Internet Coverage
